the 1st Compact Wick Adjustment Type Drill Holder

Drilling and reaming require center height alignment with precision to the level of μm . Such an alignment is usually performed with the aid of a center alignment holder that has a large protrusion. If you attempt to attach a holder like this to a two-hole holder or our compact NC lathe, you may encounter the problem of interference. As illustrated, these protrusions for center alignment may interfere with each other.

The center alignment drill holder photographed below adopts an eccentrically structured drill insertion part and shank. The holder is compact enough to fit in a two-hole holder.

This compact center alignment drill holder easily fits in TAKAMAZ compact machines. It helps achieve stable operation during small-diameter drilling.
